

Antigravity + DeepSeek V4 Pro

Patch Guide: Configure Antigravity IDE to Use DeepSeek V4 Pro via API

1. Overview

Google Antigravity is an agent-first AI development platform that uses Chromium Shared Storage (PROTOBUF + LevelDB) for local configuration. By default, it ships with Google Gemini models. This guide walks you through patching Antigravity to use DeepSeek V4 Pro as the primary model through the OpenAI-compatible API layer. DeepSeek V4 Pro supports both the OpenAI ChatCompletions API and the Anthropic Messages API, making it a drop-in replacement for Gemini within Antigravity.

What You Need

Before proceeding, ensure you have the following prerequisites in place. You will need an active DeepSeek API key, which can be obtained from the official DeepSeek platform. You also need Google Antigravity installed on your machine (the app data is typically stored under AppData\Roaming\Antigravity on Windows). No additional software or proxy tools are required since DeepSeek provides a native OpenAI-compatible endpoint.

Prerequisite	Details
DeepSeek API Key	Get yours at platform.deepseek.com/api_keys
Antigravity IDE	Installed and running (latest version recommended)
API Base URL	https://api.deepseek.com (OpenAI-compatible)
Model Name	deepseek-v4-pro (or deepseek-v4-flash for lighter tasks)

2. Method A: UI Configuration (Recommended)

The simplest and safest way to add DeepSeek V4 Pro to Antigravity is through the built-in custom model provider settings. This method requires no database manipulation and works entirely through the Antigravity user interface. Follow the steps below to configure the integration.

Step 1: Open Antigravity Settings

Launch Antigravity and navigate to the Settings panel. You can access this via the gear icon in the top-right corner, or through the menu bar under Preferences. Navigate to the "Models" or "Model Providers" tab. This section lists all currently configured AI providers and their associated models. Look for an option labeled "Add Provider", "Add Custom Model", or "Bring Your Own Model" (BYOK). The exact label may vary depending on your Antigravity version.

Step 2: Configure the DeepSeek Provider

Select "OpenAI Compatible" as the provider type (since DeepSeek implements the OpenAI ChatCompletions specification). Fill in the following fields exactly as shown in the configuration table below. The API base URL must point to the DeepSeek endpoint, and the API key must be your personal key from the DeepSeek platform. Double-check the model name to avoid typos.

Field	Value	Notes
Provider Type	OpenAI Compatible	Required
API Base URL	https://api.deepseek.com/v1	Do NOT add trailing slash
API Key	sk-xxxxxxxxxxxxxxxxxx	Your DeepSeek API key
Model Name	deepseek-v4-pro	Case-sensitive
Display Name	DeepSeek V4 Pro	Any friendly name

Important: Some Antigravity versions auto-append "/v1" to the base URL. If you get connection errors, try using "https://api.deepseek.com" (without /v1) as the base URL instead.

Step 3: Save and Test

After entering all configuration values, click "Save" or "Test Connection" to verify that Antigravity can reach the DeepSeek API. If the connection test succeeds, select "DeepSeek V4 Pro" as your active model in the workspace panel. Start a new chat session to confirm the model is responding correctly. If you encounter any issues, verify that your API key has sufficient credits and that the model name is spelled exactly as "deepseek-v4-pro" (all lowercase, with hyphens).

3. Method B: Database-Level Patch (Advanced)

If the UI method does not work (due to version limitations or restricted settings), you can directly modify the Antigravity LevelDB database where provider configurations are stored. The database is located at %APPDATA%\Antigravity\shared_proto_db\ on Windows. This method requires careful handling of the protobuf-encoded data. Before making any changes, back up the entire Antigravity folder to prevent data loss.

Step 1: Back Up Your Database

Close Antigravity completely before proceeding. Navigate to the Antigravity data directory and copy the entire "Antigravity" folder to a safe location. The LevelDB database files (000003.log, CURRENT, LOCK, LOG, LOG.old, MANIFEST-000001, and the metadata/ directory) must all be preserved in their original state. If anything goes wrong, you can restore from this backup.

Step 2: Modify Provider Configuration

The Antigravity configuration is stored in PROTOBUF format inside the LevelDB shared_proto_db. You will need a LevelDB reader tool (such as "leveldb-dump" or Python "plyvel" library) and a Protocol Buffers decoder to read and modify the entries. Look for keys containing "model_provider" or "api_endpoint" in the metadata directory. The relevant protobuf message typically contains fields for provider_name, api_base_url, api_key (stored in the system credential store, not in LevelDB directly), and model_id.

Set the following values in the provider configuration entry:

```
# Provider configuration fields to modify in protobuf:
provider name: "DeepSeek"
provider type: "OPENAI COMPATIBLE"
api base url: "https://api.deepseek.com/v1"
model id: "deepseek-v4-pro"
display name: "DeepSeek V4 Pro"
auth_type: "BEARER_TOKEN"
```

Step 3: Store the API Key Securely

Antigravity stores API keys in the system credential store (Windows Credential Manager), not directly in the LevelDB database. After modifying the provider configuration, you need to add your DeepSeek API key to the credential store. You can do this through the Antigravity UI (Settings > Model Providers > Edit > API Key) or by using the Windows command line with "cmdkey" to add a generic credential. The target name typically follows the pattern "Antigravity:DeepSeek" or

similar.

Warning: Direct database modification can corrupt your Antigravity installation if done incorrectly. Always keep a backup. The UI method (Method A) is strongly recommended for most users.

4. Configuration File Alternative

Some newer versions of Antigravity support a JSON-based configuration file that can be edited directly. Check if the following file exists in your Antigravity data directory:

```
%APPDATA%\Antigravity\config.json  
or  
%APPDATA%\Antigravity\models.json
```

If present, add or modify the provider entry as follows:

```
{  
  "providers": [  
    {  
      "name": "DeepSeek",  
      "type": "openai compatible",  
      "api base url": "https://api.deepseek.com/v1",  
      "api key env": "DEEPSEEK API KEY",  
      "models": [  
        {  
          "id": "deepseek-v4-pro",  
          "display name": "DeepSeek V4 Pro"  
        },  
        {  
          "id": "deepseek-v4-flash",  
          "display name": "DeepSeek V4 Flash"  
        }  
      ]  
    }  
  ]  
}
```

Set the DEEPSEEK_API_KEY environment variable in your system (Windows: System Properties > Environment Variables, or via PowerShell with `$env:DEEPSEEK_API_KEY="sk-xxx"`). Restart Antigravity after saving the configuration file.

5. Environment Variable Method (Windows)

As an alternative to storing the API key in the config file, you can set it as a system environment variable. This is the most secure approach since the key is never written to disk in plain text. Open PowerShell as Administrator and run the following commands:

```
# Set persistent environment variable (Admin PowerShell)
[System.Environment]::SetEnvironmentVariable(
    "DEEPSEEK_API_KEY",
    "sk-your-actual-api-key-here",
    [System.EnvironmentVariableTarget]::User
)

# Verify
$env:DEEPSEEK_API_KEY
```

After setting the environment variable, restart Antigravity completely (close all windows and relaunch). The provider configuration will automatically pick up the API key from the environment.

6. Verification and Troubleshooting

After completing any of the methods above, verify your configuration by opening a new chat session in Antigravity and sending a simple test message. The model indicator in the UI should show "DeepSeek V4 Pro" instead of the default Gemini model. If you encounter issues, review the troubleshooting table below for common problems and their solutions.

Problem	Cause	Solution
Connection timeout	Firewall blocking api.deepseek.com	Check network/firewall rules
401 Unauthorized	Invalid or expired API key	Regenerate key at platform.deepseek.com
Model not found	Model name typo	Use exact: deepseek-v4-pro
Double /v1/v1 path	Base URL has /v1, Antigravity adds /v1	Remove /v1 from base URL
Empty responses	API credit exhausted	Top up at DeepSeek platform

Config not saving	Antigravity still running	Close Antigravity before editing files
-------------------	---------------------------	--

7. Quick Reference: DeepSeek API Details

For your convenience, here is a summary of all the DeepSeek API details you need for the integration. The DeepSeek V4 Pro API is fully compatible with the OpenAI ChatCompletions specification, supports both standard and thinking/reasoning modes, and is available through multiple gateway endpoints for maximum reliability.

Parameter	Value
API Endpoint (OpenAI)	https://api.deepseek.com/v1/chat/completions
API Endpoint (Anthropic)	https://api.deepseek.com/anthropic/v1/messages
Model (Pro)	deepseek-v4-pro
Model (Flash)	deepseek-v4-flash
Auth Header	Authorization: Bearer sk-your-api-key
Context Window	128K tokens (standard), up to 1M with extended context
Thinking Mode	Append [1m], [5m], or [15m] to model name for thinking duration
Key Management	https://platform.deepseek.com/api_keys
API Docs	https://api-docs.deepseek.com

Thinking Mode Tip: When using deepseek-v4-pro in Antigravity, you can append thinking duration modifiers to the model name for complex reasoning tasks. For example, use "deepseek-v4-pro[1m]" for 1-minute thinking or "deepseek-v4-pro[5m]" for deeper analysis. Use "deepseek-v4-flash" for quick, routine coding tasks to save API credits.
